(54) Title: USE OF OXAZOLIDINONE-QUINOLINE HYBRID ANTIBIOTICS FOR THE TREATMENT OF ANTHRAX AND OTHER INFECTIONS

WO 2004/096221 A1

Use of oxazolidinone-quinoline hybrid antibiotics for the treatment of anthrax and other infections

The present invention describes the use of compounds in which the pharmacophores of quinolone and oxazolidinone are chemically linked together through a linker that is stable under physiological conditions for the treatment of anthrax and other infections.

Anthrax is an acute infectious disease caused by the spore-forming bacterium *Bacillus anthracis*. Anthrax most commonly occurs in wild and domestic lower vertebrates (cattle, sheep, goats, camels, antelopes, and other herbivores), but it can also occur in humans when they are exposed to infected animals or tissue from infected animals. *Bacillus anthracis*, the etiologic agent of anthrax, is a large, gram-positive, non-motile, spore-forming bacterial rod. The three virulence factors of *B. anthracis* are edema toxin, lethal toxin and a capsular antigen. Human anthrax has three major clinical forms: cutaneous, inhalation, and gastrointestinal. If left untreated, anthrax in all forms can lead to septicemia and death. Recently, anthrax has become of considerable interest, because it is considered to be a potential agent for use in biological warfare.

The present invention provides the use of compounds of Formula (I) for the treatment of anthrax and other infections:
